**Sketching, Wireframe,
from low to high fidelity**

Sketching Techniques: From Idea to Final Design

Sketching on paper is a good way to quickly lay out multiple possibilities, whereas high-fidelity wireframes are better for modelling the final design.

When to use one and when the other? When do we apply exact measurements and **colors**, and when do we not?

Sketching On Paper

The reason for using hand-drawn sketches is to find a better way to **quickly** lay out multiple **possibilities**. In this phase, we can try radically different ideas and unusual concepts as well. Most commonly, these sketches are intended to bring focus to the introduction of an idea and hence they are made up from lines and contain only rough text.

What's in it:

visual hierarchy (which elements are more emphasized?)

layout

main processes

Ratios

What's not in it:

exact ratios, measurements

branding

colors

colored surfaces (only lines)

intervals

exact text

What details are included?

Highlight the primary concept being captured

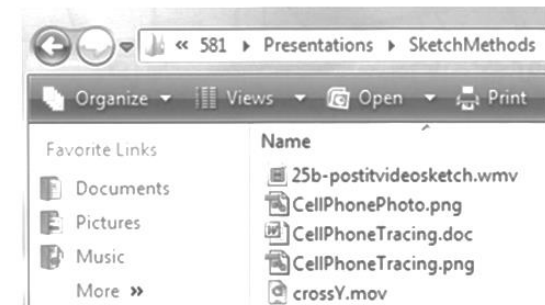

- The structure of the pane;
- A few key buttons and fields in a stylized form.

What is abstracted as a caricature?

Less important aspects are muted;

- The icons and labels (which represents files, folders and commands) are shown throughout as a box with scribble text.

What is left out?

Non-important details are omitted entirely;

- All the **decorations, actual text and** lesser interface controls are excluded;
- Decorations that make this look good are not included, as are the actual text of the various components.

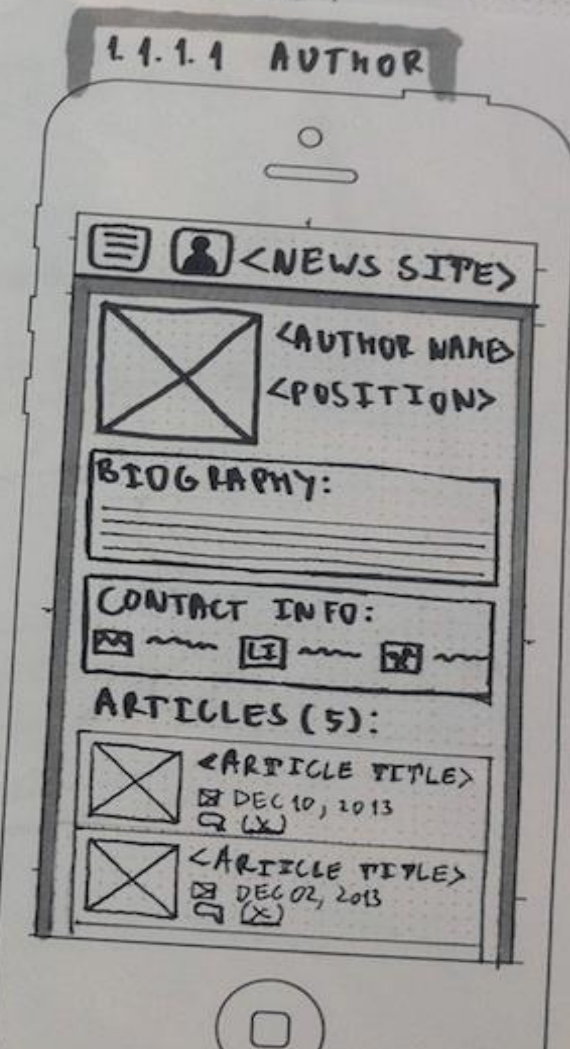

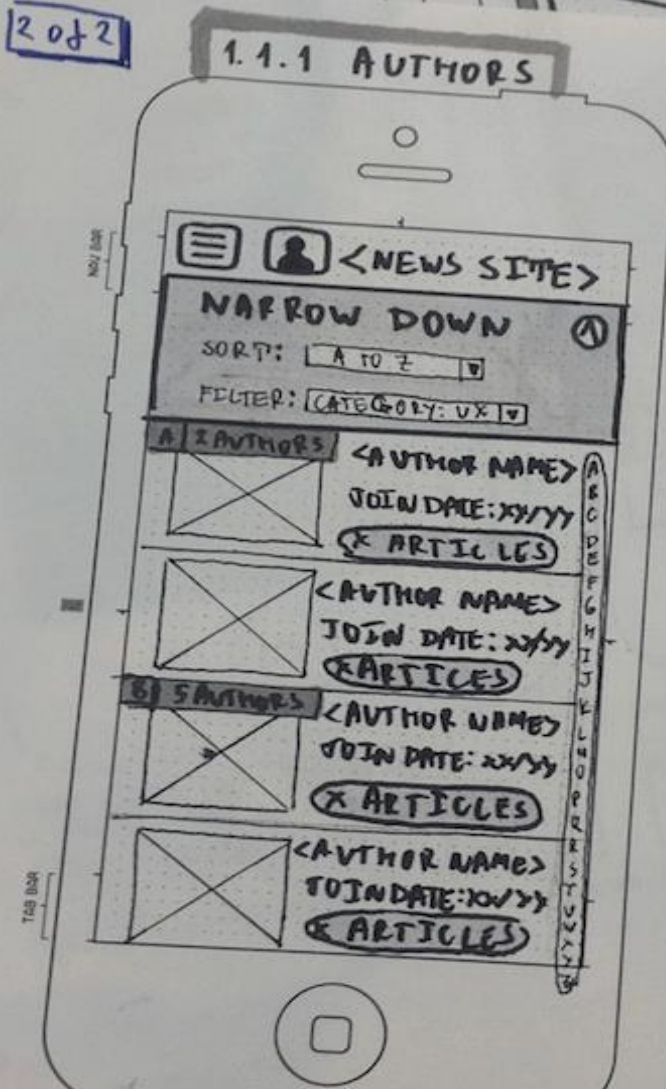

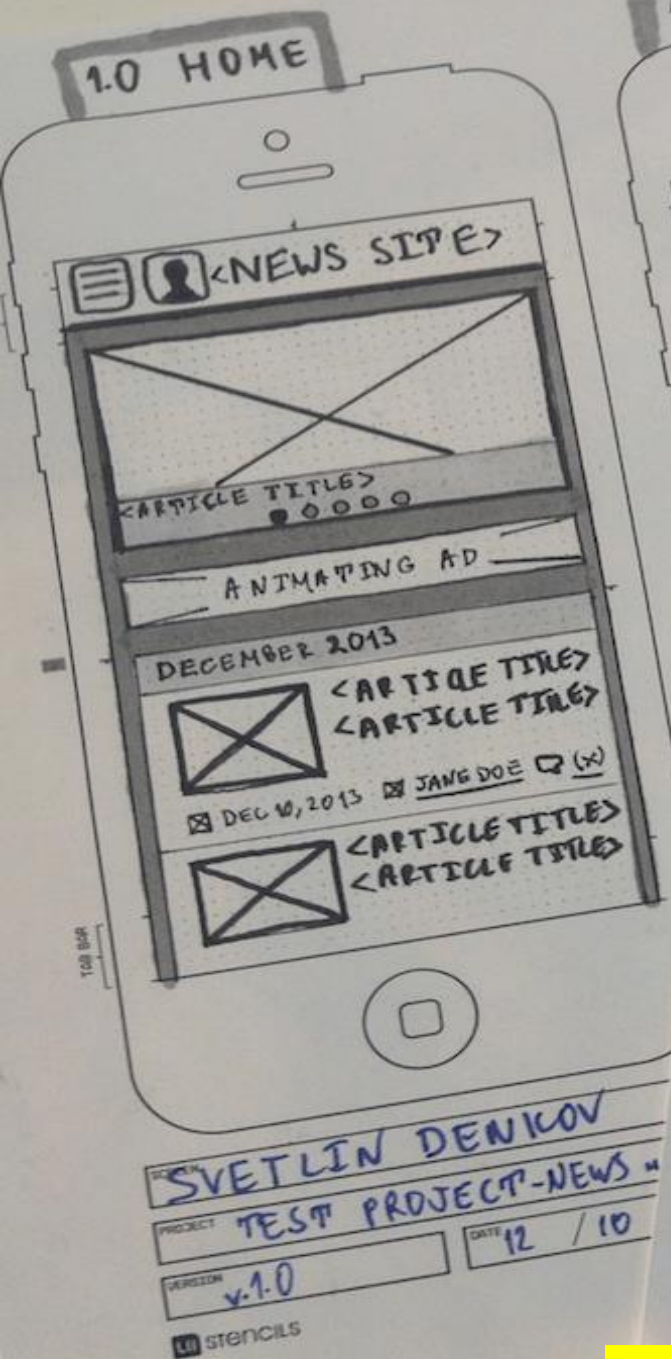

The **scribble sketch** you create depends totally on what you want to emphasize.

Here the sketch captures a different idea, in this case the various interaction methods used in the title bar to rapidly navigate to other folders.

Also includes few annotations to explain the scribbles.

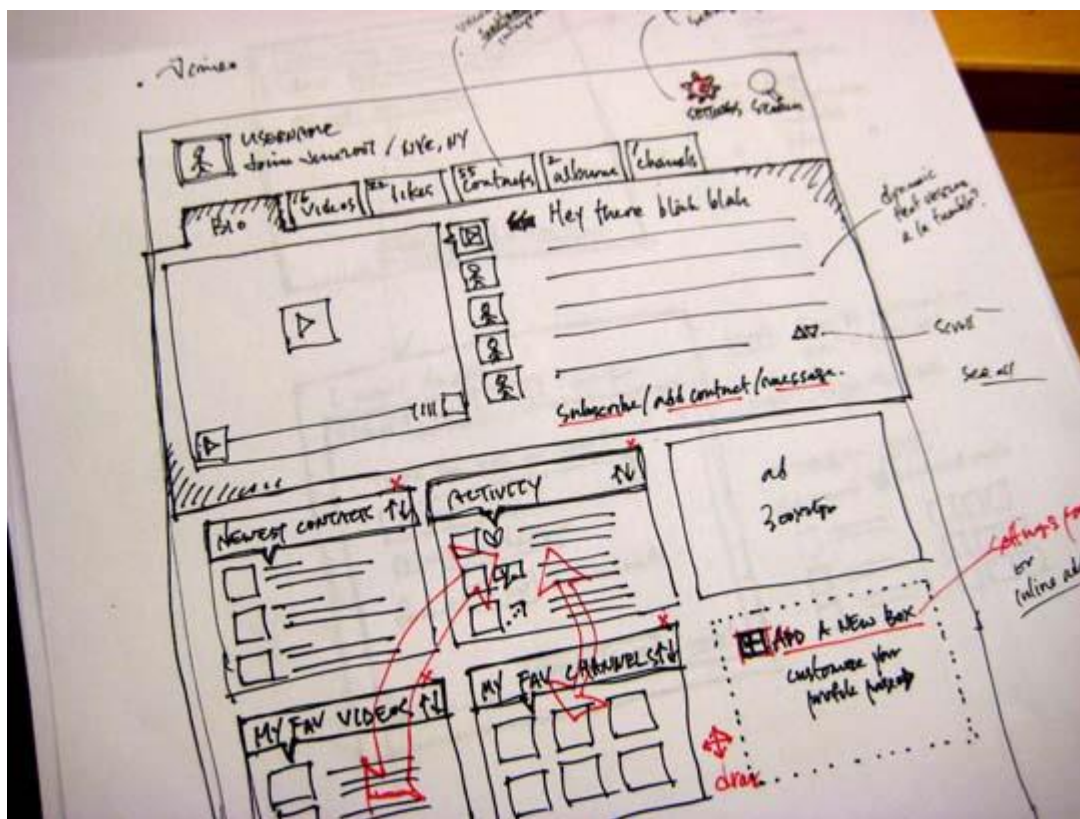

It Saves a Lot of Energy

Photoshop and similar programs may be useless here until you have a detailed plan of the whole thing.

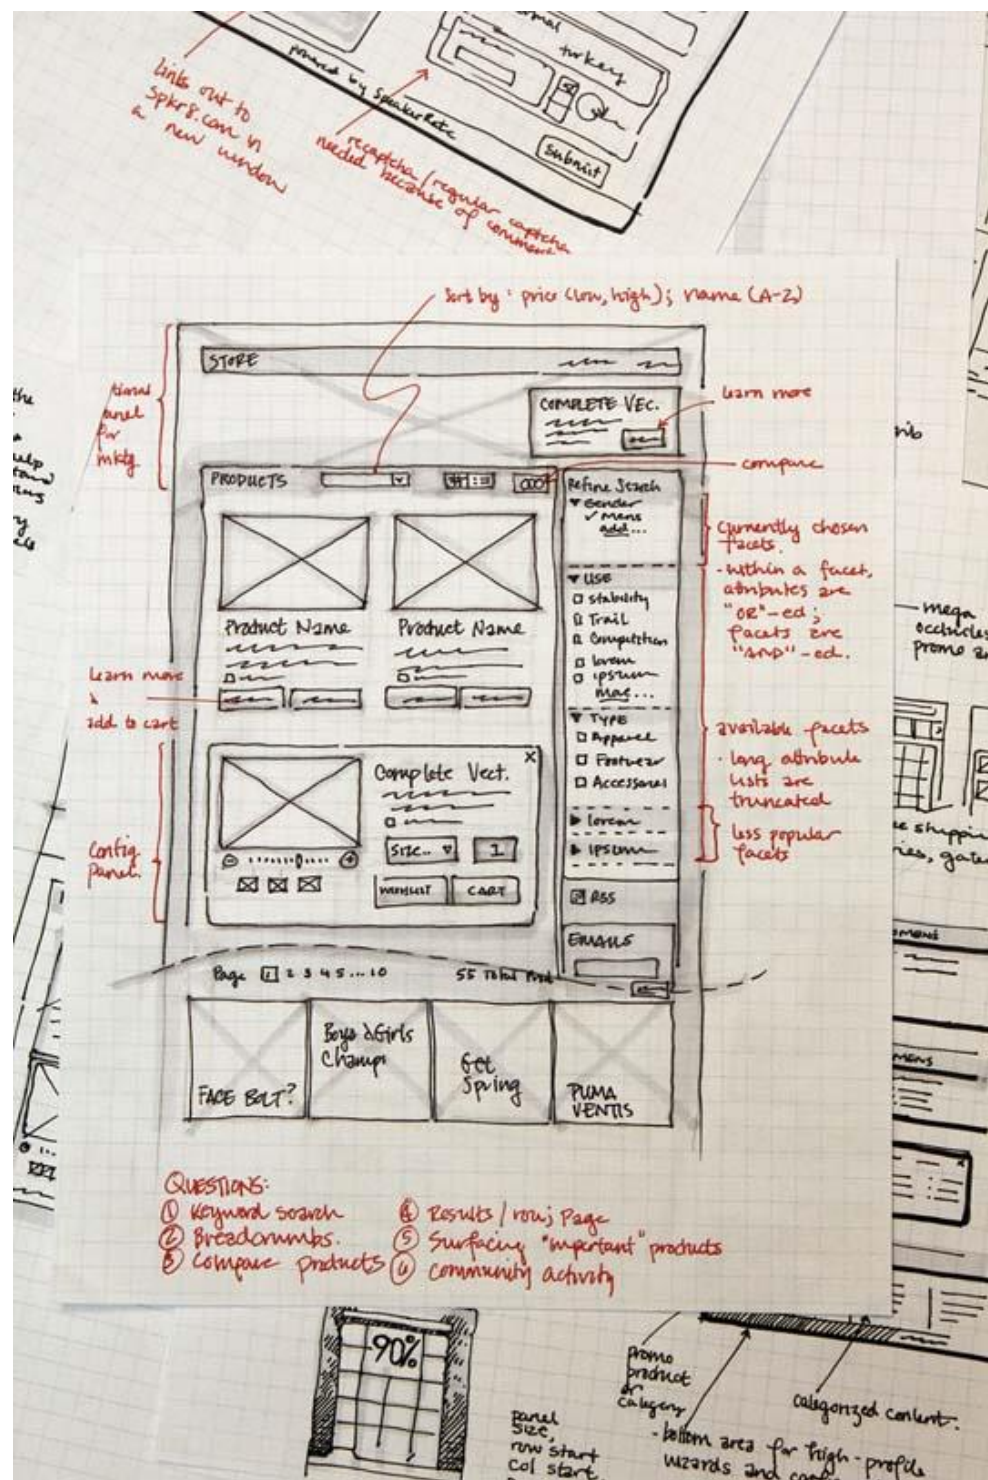

Using computer software **will take much more time and energy** as you will most likely have to redo the whole thing.

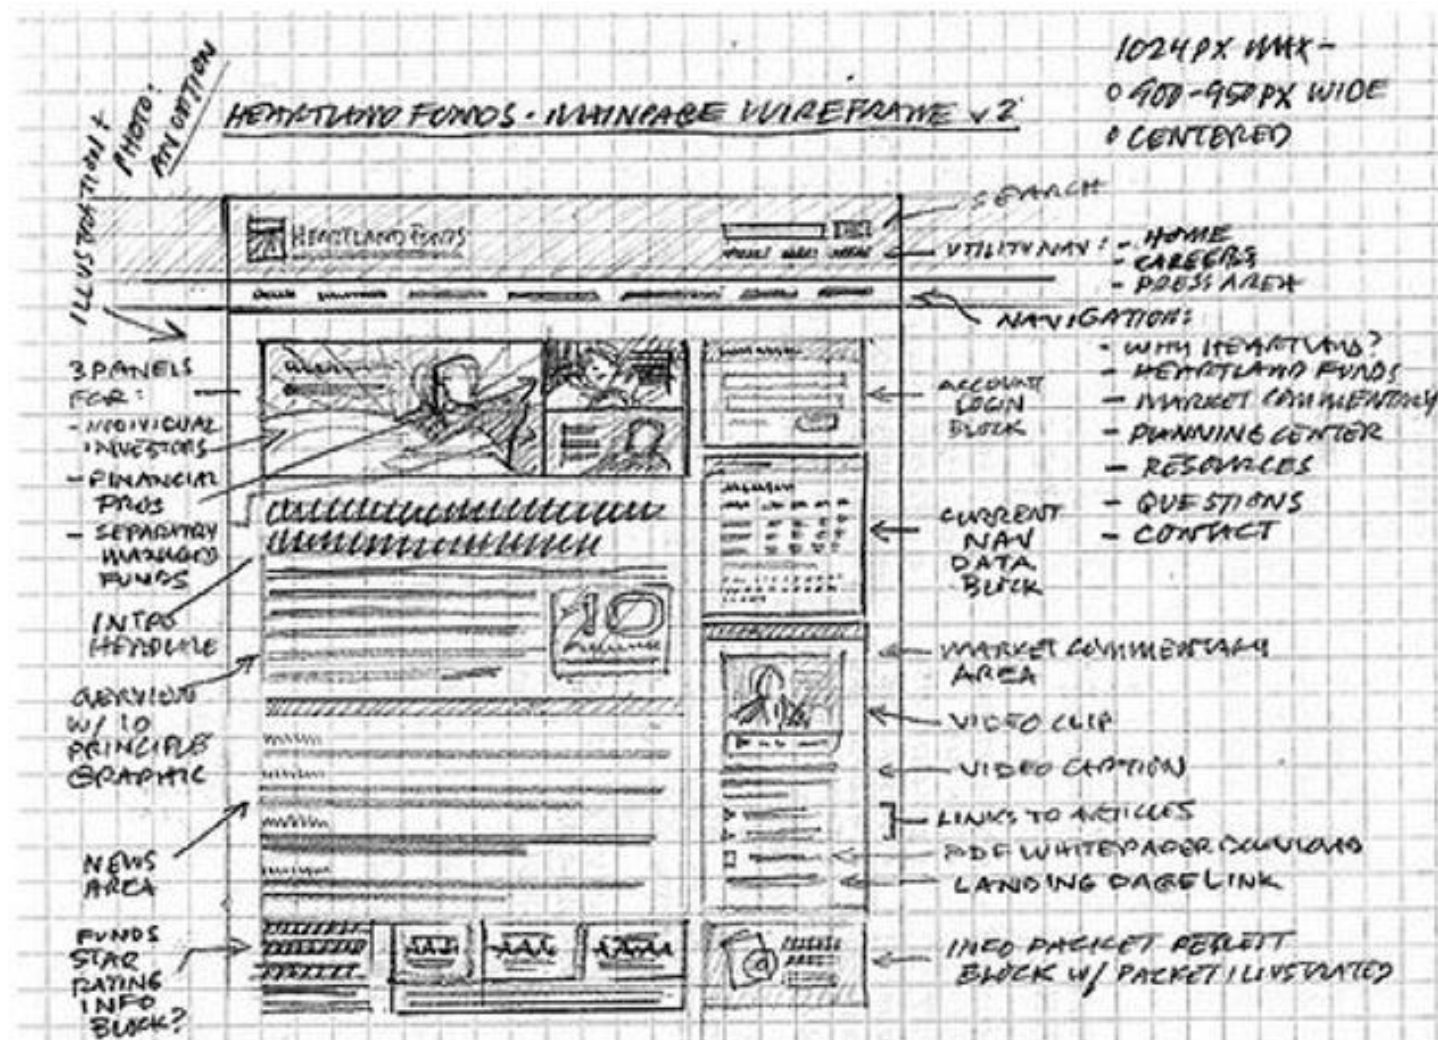

First drafts are very seldom good to go; you usually have to make alterations and add different features along working on it. It is much better to do everything right from the first time, isn't it?

③ Google Now
ideas.

Many of the ideas

④ New on tap

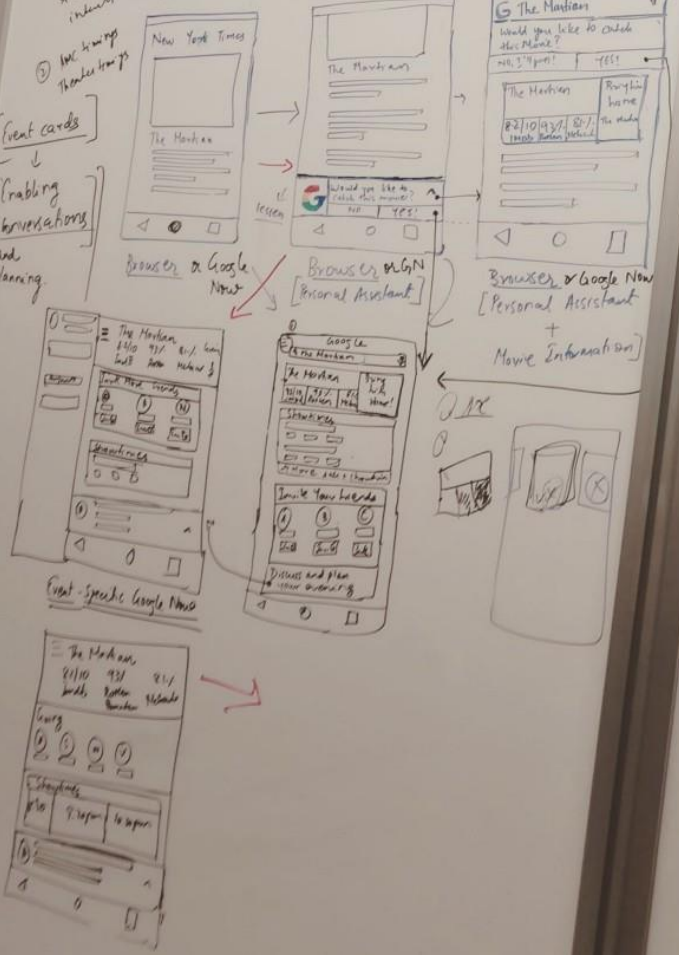

⑤ De Google,
my meeting has
been cancelled

⑥ The person takes
control of everything

Ad-hoc → New information comes in
that encourages a new action/event.

Scenario 2 - Serendipitous Movie Discovery

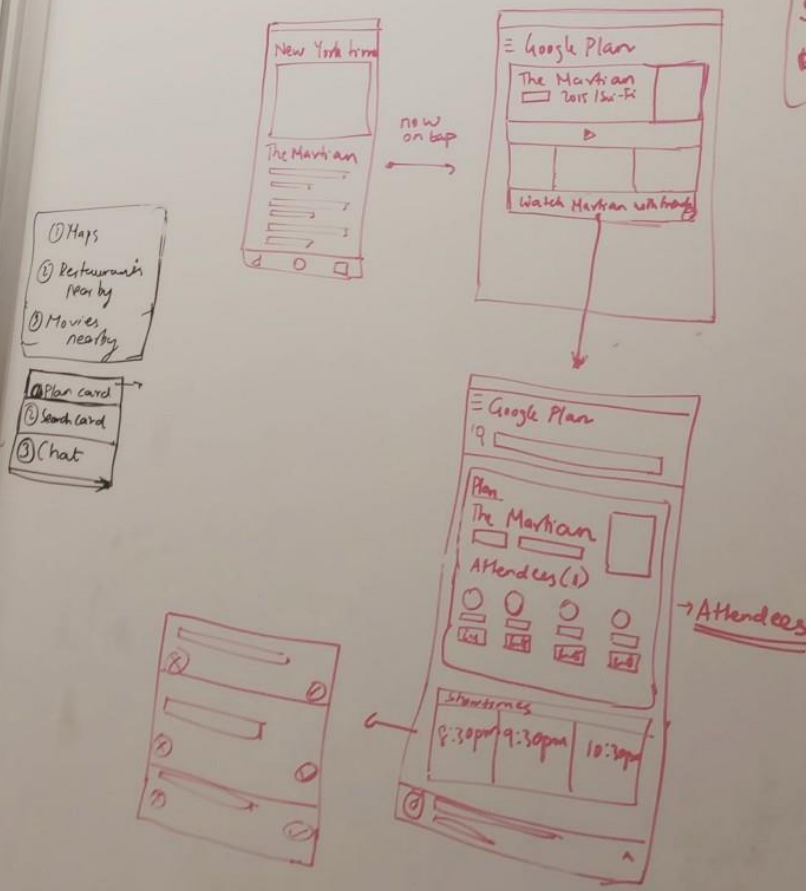

(without now on tap).

① Flight delayed

Scenario 3 - Meeting has been cancelled.

→ Movie + Dinner.

PAPER SKEETCH PROTOTYPING

- Instrumento valioso numa fase inicial do design functional.
- Permite tomar decisões sobre a organização visual aplicação.
- Avaliar decisões ao nível da navegação e layout numa fase inicial.

LOW-FIDELITY WIREFRAME

This kind of sketching technique is **digital**, made with a wireframing tool. Its primary purpose is to make the **concept testable**, even functioning as a clickable prototype. On this level, it is useful to come up with some alternative sketches: by testing, we can decide how viable our ideas are.

What's in it:

- exact ratios (but not exact measurements)
- maximum 2-3 shades of grey (still, the best is to only use lines)
- copywriting
- basic functions are clickable

What's not in it:

- exact intervals, pixel accuracy
- profile, branding colors
- grid

HALLOWEEN 2012

HIGH-FIDELITY WIREFRAME

A more elaborated version of the previous technique, both in function and layout. **This is usually a clickable prototype**, in which most of the screens are fully developed. It aims at showing closer resemblance to the **final design**, yet still not showing complete resemblance. Measurements are accurate, and more shades of grey are allowed. We should only use other colors if it is really necessary, because unfounded use of extra colors can mislead the testers during testing. Greater refinement leads to a more vivid imagination regarding future layout; besides, we can receive a more reliable feedback

What's in it:

- grid
- exact measurements
- shades of grey
- basic color concept

What's not in it:

- pixel accuracy
- fonts
- final icons

COLLEGE ANNOUNCEMENT

Pellentesque et ligula dolor, ut consetetur nunc. Praesent et sagittis diam. Morbi

HIGH-FIDELITY WIREFRAME

- Better for documentation because of their increased level of detail.
- Often include information about each particular item on the page, including dimensions, behavior, and/ or actions related to any interactive element.

LOW-FIDELITY WIREFRAME

- Help facilitate project team communication and are relatively quick to develop.
- Tend to be more abstract because they often use simple images to block off space and implement mock content, or Latin (lorem ipsum) text as filler for content and labels.
